

Armv8-R Overview

Summary:

This course has been designed to introduce the Armv8-R architecture, the peculiarities of the R-class profile and the new capabilities.

At the end of this course you will be able to explain the key features of the Armv8-R register set and exception model, including the different levels of privilege.

You will understand the basic of the Armv8-R memory model, including the different memory types, how memory protection works and how it can be exploited to enact virtualization in real-time systems.

Prerequisites:

- Familiarity embedded programming in C and assembler
- Experience of embedded system development is an advantage

Audience:

This course is aimed at people seeking an introduction to the ARMv8-R architecture. It provides an overview of the subject, suitable for people without prior experience of working with Arm processors, but who do have a general familiarity with embedded programming or design.

Delivery method:

- Online

Length:

1 hour
